

The figure consists of four subplots arranged in a 2x2 grid, each showing the percentage of correct classifications (P) on the y-axis (ranging from 0 to 100) against the Hamming distance (D) on the x-axis (ranging from 0 to 20). The subplots are labeled as follows:

- Top-left (100-32):** Shows a sharp increase in P starting around D=4, reaching a plateau of approximately 95% for D ≥ 10.
- Top-right (10-32):** Shows a sharp increase in P starting around D=4, reaching a plateau of approximately 95% for D ≥ 10.
- Bottom-left (100-9):** Shows a sharp increase in P starting around D=4, reaching a plateau of approximately 95% for D ≥ 10.
- Bottom-right (10-9):** Shows a sharp increase in P starting around D=4, reaching a plateau of approximately 95% for D ≥ 10.

In all cases, the performance is relatively stable for D=0 and D=1, and then increases sharply as D increases beyond 3. The plateau is reached around D=10 and remains constant for higher values of D.
